LIFTING FORKS AND HOOKS

Lifting forks are an ideal solution for lifting and moving pallets, rolls, pipes and other pieces that can be picked up with forks. They are widely used in warehouses, production plants, construction sites and transport and logistics centres – in any environment where the loads vary

in shape, size or centre of gravity.

PRODUCT DESCRIPTION

Lifting forks are available with either a fixed lifting bail or an automatically balancing spring mechanism. We manufacture single-, double- and multi-tine models, which can also be fitted with width and height adjustment. We also offer solutions for specially shaped and difficult-to-handle loads – always tailored to the customer's application.

We manufacture CE-marked lifting forks and hooks to suit the customer's lifting needs and operating environment. Every solution is designed in accordance with the safety requirements of the Machinery Directive.

We carefully map each customer's needs so that the end result is as functional, safe and easy to use as possible. The delivery includes comprehensive documentation, and we can also provide training in safe use of the device when needed.

Lifting forks and lifting hooks should be dimensioned according to the shape of the load, its centre of gravity and the way it is used. A correctly chosen lifting accessory makes the load easier to control and reduces handling risks, for example when lifting pallets, pipes, rolls and special pieces.

See also lifting forks, mechanical grippers, turning devices and lifting beams.
