LIGHT CRANES, KB SYSTEM, SPECIAL STRUCTURES

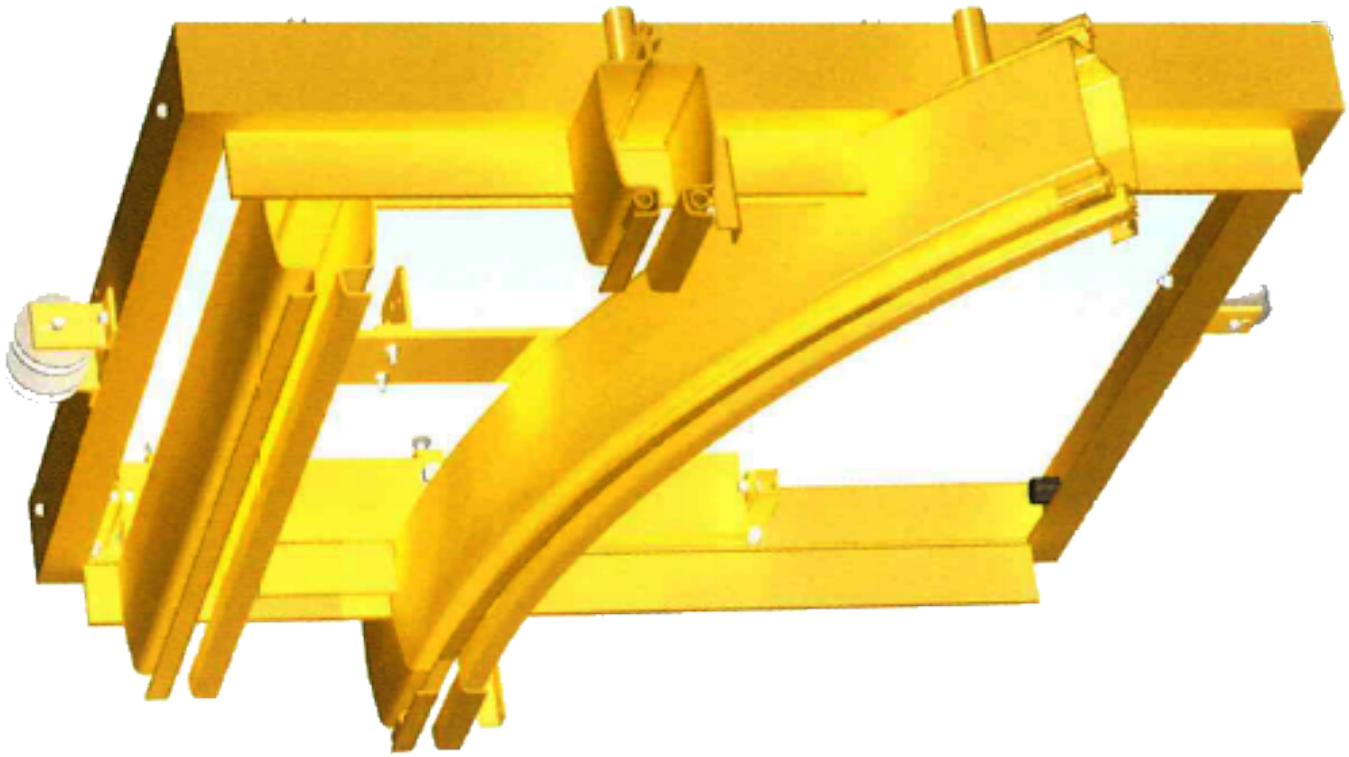

Light cranes with special structures offer flexible solutions for industrial lifting needs. Switches, turntables and telescopic solutions allow efficient, space-saving load handling.

PRODUCT DESCRIPTION

Switches

Switches allow branching tracks, so the hoist can move more freely from one area to another or along an alternative route.

Turntables

Turntables provide the same basic function as a switch, but they also make crossing tracks possible, so that on the same level two tracks can cross each other's paths.

Telescopes

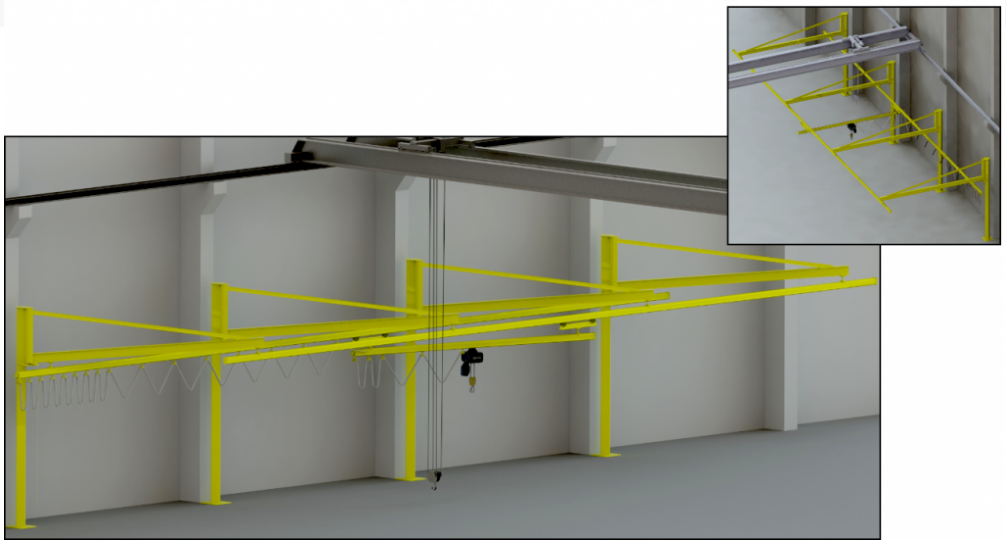

A telescopic system can create an extending track, for example through a door or other opening beyond the normal track's support point.

Bridge that folds against the wall

A crane system that folds against the wall saves space when needed. Lockable jib cranes support the track and allow it to be swung against the wall, so the space can be used more freely without the restrictions a fixed overhead crane would bring.

It allows a small space to be used in combination, for example as a truck service bay and as an assembly area with an overhead crane.
